

## 5. Complexity of matrix algorithms

- flop counts
- vector-vector operations
- matrix-vector product
- matrix-matrix product

# Flop counts

## **floating-point operation (flop)**

- one floating-point addition, subtraction, multiplication, or division
- other common definition: one multiplication followed by one addition

## **flop counts of matrix algorithm**

- total number of flops is typically a polynomial of the problem dimensions
- usually simplified by ignoring lower-order terms

## **applications**

- a simple, machine-independent measure of algorithm complexity
- not an accurate predictor of computation time on modern computers

## Vector-vector operations

- inner product of two  $n$ -vectors

$$x^T y = x_1 y_1 + x_2 y_2 + \cdots + x_n y_n$$

$n$  multiplications and  $n - 1$  additions =  $2n - 1$  flops ( $2n$  if  $n \gg 1$ )

- addition or subtraction of  $n$ -vectors:  $n$  flops
- scalar multiplication of  $n$ -vector :  $n$  flops

# Matrix-vector product

matrix-vector product with  $m \times n$ -matrix  $A$ :

$$y = Ax$$

$m$  elements in  $y$ ; each element requires an inner product of length  $n$ :

$$(2n - 1)m \text{ flops}$$

approximately  $2mn$  for large  $n$

## special cases

- $m = n$ ,  $A$  diagonal:  $n$  flops
- $m = n$ ,  $A$  lower triangular:  $n(n + 1)$  flops
- $A$  very sparse (lots of zero coefficients):  $\# \text{flops} \ll 2mn$

# Matrix-matrix product

product of  $m \times n$ -matrix  $A$  and  $n \times p$ -matrix  $B$ :

$$C = AB$$

$mp$  elements in  $C$ ; each element requires an inner product of length  $n$ :

$$mp(2n - 1) \text{ flops}$$

approximately  $2mnp$  for large  $n$
